TMX

The TMX is a high-lift hand truck with capacity of 2,000 lbs to the full lift height. This new truck combines the advantages of the famous Multiton hand pallet truck with the ones of a lift-table. Thanks to its telescopic jack, the forks can be raised to the desired height up to 31".

Controls:

All controls are mounted on the handle.

- Driving: the TMX can be used as a normal hand-pallet truck, in low position, to move the pallets.
- Lifting: the three position control lever for lift, lower and neutral, is located on the center column.

The hydraulic pump unit is the same as the Multiton HPT, cast iron block.

with all wearing parts interchangeable, with a sealed fluid system that is fully air tight.

Jack:

The telescopic jack is composed of 2 rods. Most of the elevation is made through the large section rod, creating a light pumping force, and giving great rigidity.

Stabilizers:

Two lateral stabilizers automatically come into contact with the ground when the forks reach a lifting height of 14". When stabilizers are lowered, the steering wheels are raised 2" off the ground. The truck is then immobile, giving good stability.

Construction:

Automatically welded steel sheet frame. Very robust. All articulations are fitted with grease fittings,

Wheels:

- 2 polyurethane type steering wheels: 8" x 2".
- 2 nylon single load rollers" 3 1/4" x 2 5/16".

Options:

- Brake.
- rollers under the stabilizers.
- Slip on platform.
